
Fight COVID-19 Pandemic

3 minute Video to show you how to test the mask that you purchase

Dr. Gerald Evans, an infectious disease specialist at the Kingston General Hospital in Kingston, Ontario, said: "To every symptomatic person found, there might be as many as 10 other persons out there who are either asymptomatic (absolutely no symptoms) or mildly symptomatic."

It was confirmed through an incident in Berlin late February, in which one person infected 16 others at the Trompete nightclub. In Hong Kong, with one family gathering, over 9 COVID-19 cases were confirmed afterwards. This is very serious - people with a mild cold or running nose could be a carrier. That is highly infectious.

1. Please consider wearing a mask when you meet other colleagues or out grocery shopping. It helps to stop the spread of the virus if you happened to be asymptomatic.
2. Practice personal hygiene. Wash your hand for 20 seconds or use sanitizer regularly when you are touching different surfaces, like grocery carts, washroom doors, elevator buttons, etc.
3. Discuss with your team how to measure temperature with a no touch thermometer. We care for each other and it will definitely help to identify anyone with a slight fever and let the person stay home to recover.
4. Practice social / physical distancing. This will save people's lives close to you or save yourself.
5. Send an encouraging message to one of your friends today.
